

Project 2

The task involved performing Exploratory Data Analysis (EDA) on a sales dataset of 1,200 orders turning them into actionable insights and drawing conclusions.

Here's what I worked on:

Cleaned the dataset and identified outliers using the IQR method

Built pivot tables to break down revenue by product, order status, coupon usage, referral source & payment method

Ran correlation analysis to understand what truly drives revenue

Designed charts including a monthly revenue trend line and product/referral bar charts to tell the data story visually

Key Business Insights Uncovered:

Chair & Printer topped revenue at approximately \$195K each, while revenue was fairly balanced across all 7 products a sign of a healthy, diversified portfolio

41.4% of all orders were either cancelled or returned a serious fulfilment red flag that needs urgent attention

Instagram led referral sources with 259 orders, making it the top-performing marketing channel

Unit price has a stronger correlation with total revenue ($r = 0.72$) than quantity ($r = 0.62$) meaning selling higher-priced products matters more than selling more units

The average order value of \$1,053.97 is skewed by a small number of high-value bulk purchases

Beyond the technical skills, this task taught me how to think critically about data not just analyse it, but ask the right questions and translate numbers into business decisions. This shift in mindset has been the biggest personal win for me this week.
